01 / Claim

What capability are we testing, under which conditions?

EX02 / UMI | Source analysis | C1 | P: paper; W: project; R: repository

On reported dynamic tossing, UMI latency matching improves object-level success with the same trained policy.

1. System and capability

Name your system, tested capability and physical mechanism. Separate your proposed claim from published results.

Handheld grippers record demonstrations; a robot executes a diffusion policy. Focus: dynamic tossing, with and without inference-time latency matching. [P V-B]

2. Conditions and boundary

State task, configuration, conditions and exclusions. Use Project development for your own final project.

Six object types are routed to designated bins. The observation/action timing change is tested at deployment, not by changing the training set. [P V-B]

3. Measure and comparison

Define measure, units, trial unit, criterion and comparator before evaluation. Label proposed versus observed values.

Reported object successes: 105/120 (87.5%) with matching, 69/120 (57.5%) without. Unit: object outcome, not episode or demonstrations/hour. [P V-B]

4. Purpose and next test

Select one feasible pilot and check resources/access. State what outcome would challenge the claim; results may be pending.

Offline pilot: trace measured delays and release timing for one rollout; pass when every stream has an explicit clock, unit and alignment rule. [P Fig 5; App A]

Review: Could your system work as shown while your claim is still false? Write one such outcome.

Example response: Demonstrations/hour does not test the tossing claim; compare correctly binned object outcomes.

Worksheet 1 / Claim - evidence and team review

EX02 / UMI | SOURCE ANALYSIS EXAMPLE | Original review-page layout

Example ID: EX02 Project: UMI Claim ID: C1 Revision: draft 2

Mode: Source analysis Pages: canvas + this review; Decision also includes both A3 sides

Evidence scope: selected paper text/tables checked 20 Oct 2026; no raw dataset download or independent experiment.

Evidence ID	Artifact/source + location (clickable)	What it supports; limitation / access gap
P	arxiv.org/html/2402.10329v3	Paper: method/results; reported evidence, not our measurement.
W	real.stanford.edu/umi	Project: system/videos; selected examples do not establish reliability.
R	github.com/real-stanford/universal_manipulation_interface	Repository: linked route; code, raw data and current commit not audited.

Next action / owner / verification:

Analyst: extract the V-B matched/unmatched object counts; verify the denominator is objects rather than episodes.

Teaching example: no actual student team or signatures. Source analysis is not a reproduced result; blank signature fields are intentional.
